1 Introduction

1.1 A bilinear Form

let E be an R -vs and $\theta : E \times E \rightarrow R$, we say, θ is a bilinear form if:
 $\forall (u, v, w) \in E^2$ and $\forall a \in R$,

- $\theta(u + v, w) = \theta(u, w) + \theta(v, w)$
- $\theta(au, v) = a\theta(u, v)$

Proposition 1

let E be an R -vs of finite dimension 'n'. We have $B = (e_1, e_2, \dots, e_n)$ the basis of E .

$\theta : E \times E \rightarrow R$ a bilinear form.

Then $\forall (x, y) \in E^2, \theta(x, y) = X^t \cdot M \cdot Y$

Where M is the matrix of the bilinear form defined as:

$$M = (\theta(e_i, e_j))$$

And X and Y are the coordinates of 'x' and 'y'.

2 Inner product

A space (E, θ) is said to be an inner product space iff

- The bilinear form is '*symmetric*'
- The form is positive definite.

2.1 Symmetry

A bilinear form is symmetric iff

$$\forall (x, y) \in E^2$$

$$\theta(x, y) = \theta(y, x)$$

2.2 Positive definite

A bilinear form is said to be positive definite iff

$$\forall x \in E, \theta(x, x) \geq 0, \text{ and}$$

$$\forall x \in E, \theta(x, x) = 0 \implies x = 0$$

3 Theorems

3.1 Cauchy-Schwartz and Minkowski Theorems

Cauchy-Schwartz: Let E be an R -vs and $\theta : E \rightarrow R$ a positive definite and symmetric bilinear form, then

$$\forall (x, y) \in E^2 \mid \theta(x, y) \mid \leq \sqrt{\theta(x, x)} \times \sqrt{\theta(y, y)}$$

Minkowski's: Let (E, θ) be an inner product space on \mathbb{R} , then:
 $\forall (x, y) \in E^2, \sqrt{\theta(x + y, x + y)} \leq \sqrt{\theta(x, x)} + \sqrt{\theta(y, y)}$

4 Orthogonality

We call $N : E \rightarrow \mathbb{R}$ a norm $\forall (x, y) \in E^2$ and $\forall \lambda \in \mathbb{R}$ we have:

- $N(x) \geq 0$
- $N(\lambda \cdot x) = \lambda \cdot N(x)$
- $N(x) = 0 \iff x = 0$
- $N(x + y) \leq N(x) + N(y)$

and we say that 'N' is a norm. In geometry, this is what we call a triangular inequality.

Proposition 2 The norm for any vector $x \in E$ is $\sqrt{\theta(x, x)}$.

4.1 Pythagorean Theorem

for (E, θ) an inner product space, and $\forall (x, y) \in E^2$ such that $\langle x, y \rangle = 0$, we have:

$$\|x + y\|^2 = \|x\|^2 + \|y\|^2$$

4.2 The orthogonal of a subspace

For (E, θ) an inner product space, A^\perp is defined as:
 $\{\forall x \in E, \forall y \in A, \langle x, y \rangle = 0\}$ where $A \subset E$

Some important remarks are:

- $A \subset B \Rightarrow B^\perp \subset A^\perp$
- $A^\perp = \text{span}(A)^\perp$
- $A \cap A^\perp \subset \{0\}$
